Head Injury (Child)

Your child has a head injury. It doesn't appear serious at this time. But symptoms of a more serious problem, such as mild brain injury (concussion), or bruising or bleeding in the brain, may appear later. For this reason, you will need to closely watch your child for any of the symptoms listed below. Once at home, also be sure to follow any care instructions you're given for your child.

Home care

Watch for the following symptoms

For the next 24 hours (or longer, if directed), you or another adult must stay with your child. **Seek emergency medical care** if your child has any of these symptoms over the next hours to days:

- Headache
- Nausea or vomiting
- Dizziness
- Sensitivity to light or noise
- Unusual sleepiness or grogginess
- Trouble falling asleep
- Personality changes
- Vision changes
- Memory loss
- Confusion
- Trouble walking or clumsiness
- Loss of consciousness (even for a short time)
- Inability to be awakened
- Stiff neck
- Weakness or numbness in any part of the body
- Seizures

For young children, also watch for crying that can't be soothed, refusal to feed, or any signs of changes to the head such as bruising, bulging, or a soft or pushed-in spot.

General care

- If your child was prescribed medicines for pain, be sure to give them to your child as directed. Note: Don't give your child other pain medicines without checking with the provider first.
- To help reduce swelling and pain, apply a cold source to the injured area for up to 20 minutes at a time. Do this as often as directed. Use a cold pack or bag of ice wrapped in a thin towel. Never apply a cold source directly to the skin.
- If your child has cuts or scrapes on the face or scalp, care for them as directed.
- For the next 24 hours (or longer, if advised), your child should follow these guidelines:
 - Don't lift or do other strenuous activities.
 - Don't play sports or any other activities that could result in another head injury.
 - Limit TV, smartphones, video games, computers, and music or avoid them

Patient: GALLI,NICHOLAS R

Date:

completely. These activities may make symptoms worse.

Follow-up care

Follow up with your child's healthcare provider, or as directed. If imaging tests were done, they will be reviewed by a doctor. You will be told the results and any new findings that may affect your child's care.

When to seek medical advice

Call the provider right away if your child has any of the following:

- Pain that doesn't get better or worsens
- New or increased swelling or bruising
- Increased redness, warmth, drainage, or bleeding from the injured area
- Fluid drainage or bleeding from the nose or ears
- Sick appearance or behaviors that worry you
- Lethargy or excessive sleepiness
- Bruising around the eyes or behind the ears
- Double vision
- Repeated episodes of vomiting
- Trouble walking or talking

Concussion (Child)

A concussion is a type of brain injury. It can be caused by a direct hit or blow to the head, neck, face, or body. The force of the blow makes the head and brain shake quickly back and forth. This can cause headache, nausea, vomiting, or dizziness. A child's behavior, walk, or speech can change. Your child may also lose consciousness for a time. Your child may have a blank stare. He or she may seem confused or have trouble remembering things. For example, your child may ask the same questions over and over. Your child might stumble when walking, easily laugh or cry, or he or she may have trouble sleeping. If the symptoms are severe, your child should be evaluated in the emergency room. This could mean a more severe brain injury is possible.

It can take from a few hours up to a few days to get better. The length of time depends on how hard the blow to the head was. In some cases, symptoms last a few months or longer. This is called post-concussion syndrome.

Symptoms should get better as the hours and days go by. Symptoms that get worse could be a sign of a more serious brain injury. This might be a bruise or bleeding in the brain. Watch for the warning signs listed below. Your child's healthcare provider will tell you about any other care needed.

Home care

If your child's injury is mild and there are no serious signs or symptoms, you can watch him or her at home. If the injury is more serious, take your child to his or her healthcare provider or the emergency department. Follow these guidelines when caring for your child at home:

- You will likely not have to wake your child from sleep after a minor head injury. But, if your child's healthcare provider does recommend this, your child should be able to know where they are when awakened. Ask your child's healthcare provider if you need to wake your child during the night. If so, ask how often. If not, then let your child rest as needed.
- Carefully watch your child for any of the symptoms listed below. If you notice any of them, call 911 right away or seek medical care right away.
- Ask your child's healthcare provider when it will be safe to let your child return to normal play if he or she has no symptoms.
- Don't let your child return right away to sports or any activity that could result in another head injury. Wait until all symptoms are gone and your child's healthcare provider says it's OK. A second head injury before fully getting over the first one can lead to serious brain injury. Ask your child's healthcare provider if you have questions about when your child can return to playing sports.
- Don't give your child aspirin or ibuprofen after a head injury. You may give your child acetaminophen to control pain, unless another pain medicine was prescribed. If your child has long-term (chronic) liver or kidney disease, or ever had a stomach ulcer or gastrointestinal bleeding, talk with your healthcare provider before using these medicines.
- If your child's face or scalp is swollen, apply an ice pack. Do this for 20 minutes every 2 to 3 hours until the swelling starts to go down. To make an ice pack, put ice cubes in a plastic bag that seals at the top. Wrap the bag in a clean, thin towel or cloth. Never put ice or an ice pack directly on the skin.
- School and other activities that require concentration can be more difficult after a

Patient: GALLI,NICHOLAS R
 Account No: E00934693563
 Unit No: E000800776
 Location: TRINITY EMERGENCY DE...
 Physician: Barr,James DO
 Date:

concussion. They may also delay recovery. Ask your child's healthcare provider if it is safe to return to school or do other things that require a lot of focus.

- Getting back to normal life activities within 7 days of the concussion may lead to a better recovery. This includes getting back to physical activity. But talk with your provider about what is best for your child.

Follow-up care

Follow up with your child's healthcare provider, or as advised.

Special note to parents

Healthcare providers are trained to see injuries such as this in young children as a sign of possible abuse. You may be asked questions about how your child was injured. Healthcare providers are required by law to ask you these questions. This is done to protect your child. Please try to be patient.

When to seek medical advice

Call your child's healthcare provider right away if any of these occur:

- Fever (see Fever and children, below)
- Neck pain or stiffness
- Headache that won't go away
- Dizziness that won't go away

Call 911

Call 911 or get medical care immediately if any of these occur:

- Swelling or bruising on head that gets worse
- Bulging soft spot on top of baby's head
- Pain doesn't get better or gets worse. Babies may show pain as crying or fussing that can't be soothed.
- Eyes that look black from very large pupils
- One pupil is larger or smaller than the other
- Blank stare
- Clear or bloody fluid coming from ear or nose
- Worsening headache
- Clumsiness or shaking
- Confusion
- Abnormal behavior
- Worsening dizziness
- Sleepiness or trouble waking from sleep
- Trouble speaking
- Trouble walking or using arms or legs
- Seizures
- Repeated vomiting (It's common to vomit once after a head injury. But, if this happens more than that, get medical care right away.)

Fever and children

Always use a digital thermometer to check your child's temperature. Never use a mercury thermometer.

For infants and toddlers, be sure to use a rectal thermometer correctly. A rectal thermometer may accidentally poke a hole in (perforate) the rectum. It may also pass on germs from the stool. Always follow the product maker's directions for proper use. If you don't feel comfortable taking a rectal temperature, use another method. When you talk to your child's healthcare provider, tell him or her which method you used to take your child's temperature.

Here are guidelines for fever temperature. Ear temperatures aren't accurate before 6 months of age. Don't take an oral temperature until your child is at least 4 years old.

Infant under 3 months old:

- Ask your child's healthcare provider how you should take the temperature.
- Rectal or forehead (temporal artery) temperature of 100.4°F (38°C) or higher, or as directed by the provider
- Armpit temperature of 99°F (37.2°C) or higher, or as directed by the provider

Child age 3 to 36 months:

- Rectal, forehead (temporal artery), or ear temperature of 102°F (38.9°C) or higher, or as directed by the provider
- Armpit temperature of 101°F (38.3°C) or higher, or as directed by the provider

Child of any age:

- Repeated temperature of 104°F (40°C) or higher, or as directed by the provider
- Fever that lasts more than 24 hours in a child under 2 years old. Or a fever that lasts for 3 days in a child 2 years or older.

Concussions: What You Need to Know

A concussion can put your life on pause. It's a deep, significant bruise to the brain that can cause it to lose function. Dr. Joseph Congeni gives pointers on how to recognize if your child has suffered from one, and what to do about it.

Trinity Hospital (727) 834-4748

General Emergency Room Discharge Instructions

The treatment and evaluation you received have been provided on an emergency basis only and is not intended to be a substitute for, or an effort to provide complete medical care. It is important that you follow up with your primary care provider for ongoing monitoring and intervention. If your symptoms become worse or you do not improve as expected and you are unable to reach your usual health care provider, you should return to the Emergency Department. We are available 24 hours a day.

If you have been referred to a specialist, you may be contacted by ER Follow-Up Services within 24 hours to schedule your appointment. If you would like to schedule an appointment and have not received a call, please contact them at (727) 484-1410.

What To Do:

- * Take this sheet with you when you go to your follow-up visit.
- * Take all medications as directed.
- * There are occasions where additional lab tests return, such as a culture result, an X-ray or EKG is further reviewed after you are discharged. If a change in your diagnosis or treatment is indicated, we will attempt to contact you. It is critical that we have a current phone number for you.
- * If you had X-rays done, we can provide you a CD with those X-rays for your review and follow-up. Contact Radiology Department at (727) 834-4708 for additional information.
- * Culture results may take 2-3 days. We review many culture results and will attempt to contact you if the results are significant or may change your treatment.
- * You may have been given sedation and/or narcotic medications during your stay that can cause drowsiness, poor balance and poor judgement. Follow these instructions:

Do not make any legally binding, important, or difficult decisions in the next 24 hours.

Do not drive or operate heavy machinery for the next 24 hours. You will need a driver to take you home and be with you for the remainder of the day.

You should avoid dangerous activities, including bicycling, swimming or working at heights for the remainder of the day.

You should not take any alcohol, sleeping pills or medicines that causes drowsiness for at least 24 hours.

If you are a child, have an adult watch you closely for the next 12 hours.

You may temporarily feel sick, weak or dizzy. Some people will vomit if they eat too soon. As soon as you feel like you can drink without vomiting, you should try

 Physician: Barr, James DO
 Date:

water, juice or soup. You can progress to solid foods if the fluids do not cause nausea and you are feeling well.

* If you wish to receive a paper copy of your records, complete the authorization to release form located on the facility website under the Patients & Visitors section of the website. You can fax the completed form to 855-446-6008 or send via email to HSCT.MRRequest@parallon.com. For status of medical record requests, call 866-463-7272.

* Thank you for visiting our hospital. Do not forget, through MyHealthOne you can visit your health information and details from your stay. MyHealthOne consolidates many common tasks into one secure, easy-to-use online portal. You can use the portal on your desktop computer, laptop, tablet or smartphone 24 hours a day to access these features and more:

Manage the health of a loved one

Classes and events

Bill pay

Lab results

Pre-registration

Health information and visits

Find a doctor

Make an appointment

* Create a MyHealthOne account:

1. For access to your medical record online, enter www.medicalcentertrinity.com/MyHealthOne and sign up for access to our electronic patient portal.
2. Pick a username, password and enter your email address.
3. Have your social security number (SSN) available if you would like to link your health records today.
4. If you need help or have questions about MyHealthOne, call (855)422-6625
5. Please allow 48 hours for your records to be available on line.

CAUTION:

If you develop any signs of a severe allergic reaction such as difficulty breathing, wheezing, swelling of the lips and mouth, call 911 IMMEDIATELY

Preventative Health Instructions:

The care you received in the emergency department has been done on an emergency basis only and is not intended to be a substitute for regular medical care. If your condition or symptoms persist or get worse at any time, you should return to the emergency department if you are unable to contact your own physician. Please understand that although we may not have determined a specific cause of your symptoms today, further evaluation may be necessary. It is important to get a primary care provider (doctor, PA, or nurse practitioner) for follow up as well as ongoing healthcare needs.
